The invention relates to a purified polypeptide with alpha-amylase contivity and the polynucleotide encoding it. The polypeptide is useful controlled for hydrolysing starch linkages, for catalysing the breakdown of a construction, for modifying small molecules, for liquefying starch, for washing continuously fibre properties, for treating lignocellulosic fibers, for improving fibre properties, for enzymatic de-inking of recycled paper could, and for increasing the flow of production fluids from a mixed coup, and for increasing the flow of production fluids from a mixed couple for production by removing a viscous, starch-containing, damaging coupleties is also useful for preparions and found within the collegeptide is also useful for preparions and found within the completed from the dough and in corn-wet milling processes, detergents, baking processes, beverages, oil fields (fuel ethanol), brewing processes and starch modification in the paper and pulp industry, for removing considered containing stains from a material and for reducing staling of bakery products. Sequences ABU03040-ABU03144 represent alpha amylase collapse tides of the invention

                                                                                                                                                                                                                                                      A method is claimed for transforming a host with a recombinant Bacillus alpha-amylase gene, made up of a stearothermophilus N- terminal and a licheniformis C-terminal. The method involves constructing a plaemid with a sequence separating the two terminals containing a unique restriction site which may be cut allowing the plasmid to recombine. See also AAN70539. Alpha-amylase variants - and reduced calcium ion o dependency with improved thermal and oxidation stability

Disclosure; Page 86-88; 111pp; English.

AAW12955, AAW12956, AAR81835 and AAR81836 represent the parent alpha-amylases used to create the variants of the invention (such as AAW12098-W12131). This sequence represents the alpha-amylase from Bacillus stearothermophilus. The variants of the invention were created using site directed, or random, mutagenesis of the INVention were created using site parent alpha-amylases. The variants of the invention can have improved thermal stability (such as at temperatures in the range of 40-70 degrees Celcius), and/or oxidation stability, and/or reduced calcium ion dependency. The variants can also have increased alpha-amylolytic activity (especially at pH values in the range of 8.5-10.5), and improved binding of a particular substrate. The variant alpha-amylases also possess improved specificity to a particular substrate, and/or improved

The variants can be used in detergent and washing compositions, and for textile desizing. The alpha-amylase variants can also be used in papermaking and beer-making processes. The variants of the invention can also be used in the production of sweeteners and ethanol from starch. (Updated on 16-OCT-2003)

The variants are produced by creating one or more of the following mutations in amino acid sequence of the parent termamyl-like alpha-amylase: T141, K142, F143, D144, F145, P146, G147, R148, G149, Q174, R181, G182, D183, G184, K185, A186, W189, S193, N195, H107, K108, G109, D166, W167, D168, Q169, S170, R171, G172, F173, F267, W288, K269, N270, D271, L277, G273, A274, L275, R211, E346, K385, G456, M457, K458, P459, G460, T461, V462, T463. The variants can be used for washing and/or dishwashing. They can also be used in the production of sweeteners and ethanol from starch, and/or for textile desizing, and in starch liquefaction and/or saccharification processes. The present amylase can function as the parent sequence in the production of the variants of the invention. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 514 AA;

                                                                                                                                                                                                                            This sequence represents the parent sequence for new variants of a parent Termanyl-like alpha-amylase with alpha-amylase activity. The variants comprise mutations in 2-6 regions/positions relative to an alpha-amylase from either of two Bacillus species in W09526397, B. stearothermophilus, B. licheniformis, B. amyloliquefaciens or Bacillus sp. #707. The alpha-amylase variants are detergent additives for use in detergents for dishwashing, manual or automatic laundry. The variants can also be used for textile desizing or starch liquefaction (e.g. for production of

```

oxidation stable alpha amylases can be used for the simultaneous desizing and bleaching or scouring of a fabric comprising starch or starch derivatives. They exhibit a better heat stability, especially in the presence of oxidising agents. They are obtained from a parent alpha amylase by replacing one or more methionine residues with any amino acid different from Cys or Met, preferably Leu, Thr, Ala, Gly, Ser, Ile or asp. The parent alpha amylase is derived from a Bacillus species. This sequence is the wild type (unmodified) alpha amylase Claim 7; Page 24; 37pp; English. Use of an oxidation stable alpha-amylase - for simultaneous desizing and bleaching or scouring of fabrics contg. starch or starch derivs.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is the mature Bacillus amyloliquefaciens alphaamylase (A). Variants of parent termamyl-like alpha-amylases (and methods of constructing them) are claimed. Examples of variants are featured above. At least one of the amino acids of the parent, which is present in a fragment identified above, is/are deleted or replaced with one or more residues, which is/are present in a fragment corresponding to a fragment of AAW14500 (Aspergillus oryzae fungamyl alpha-amylase). The variants have altered properties such as calcium dependency, substrate binding and stability. Also one or more proline or cysteine residues in the variant is modified or replaced with a non-proline or non-cystein residue such as alamine. The variants can be used for (dish)washing, as detergent additives or for fabric desizing or starch liquefaction. They can also be used for the production of sweeteners and ethanol from starch. See also AAW14498 and AAW14500
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 480 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Alpha-amylase variants and properties such as calcium
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      WPI; 1996-371424/37

The variants are produced by creating one or more of the following mutations in amino acid sequence of the parent termamyl-like alpha-amylase: T141, K142, F143, D144, F145, P146, G147, R148, G149, Q174, R181, G182, D183, G184, K185, D184, K189, S193, N195, H107, K108, G109, D166, W167, D108, Q169, S170, R171, Q172, F173, F267, W268, X269, N270, D271, L272, G273, A274, L275, X211, B346, K385, G456, N457, K458, P459, G460, T461, V462, T463. The variants can be used for washing and/or dishwashing. They can also be used in the production of sweeteners and ethanol from starch, and/or for textile desizing, and in starch liquefaction and/or saccharification processes. The present amylase can function as the parent sequence in the production of the variants of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WPI; 1999-326987/27

A variant may contain mutations in one or more solvent exposed amino acid residues to increase the overall hydrophobicity of the enzyme or the overall number of methyl groups in the side chains of exposed residues may be increased. The mutations can be incorporated by site-directed mutagenesis or by random mutagenesis. As a result of their increased stability, the variants are suitable for the industrial processing of starch, i.e. starch liquefaction and saccharification. They may also be useful for washing, dishwashing and textile desizing. Hybrid alpha-amylases comprising partial amino acid sequences derived from two or more alpha-amylases have also been created in order to increase enzyme stability
                                                                                                                                                                                                                          Alpha amylase; variant; enzyme; detergent; additive; dishwashing; washing; Bacillus licheniformis; Bacillus amyloliquefaciens; Bacillus stearothermophilus; dyeing; bleaching; scouring; textile

The enzymes have one or more amino acid residues added, deleted or substituted. The variants can also be used for textile desizing prior to scouring, bleaching and dyeing. The variants have improved thermostability, acid/alkaline stability; low temperature optimum; pH optimum; higher hydrolysis velocity and improved tolerance to other composition constituents, e.g. oxidation agents.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This protein comprises the Termamyl-like alpha-amylase of Bacillus amyloliquefaciens. The invention relates to novel variants of Termamyl-like alpha-amylases that have alpha-amylase activity and exhibit an alteration in at least one property selected from: substrate specificity; binding or cleavage pattern; thermal stability, pE/activity or pH/stability profile; stability towards oxidation; Ca2+ dependency and specific activity. The variant has one or more mutations from those listed in the specification in relation to Bacillus licheniformis Termamyl (see AAW1404). Also claimed are constructs comprising DNA encoding the variant (see AAW02471-73), and recombinant expression vectors and transformed cells containing the DNA. The Termamyl-like alpha amylase variant is useful as a detergent additive and can also be used in industrial starch processing e.g. liquefaction (claimed) or saccharification to produce sweeteners, and in textile desizing (claimed)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        30-APR-1996;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Ş
                                            This sequence represents a termamyl-like alpha amylase. The invention relates to a variant (I) of parent Termamyl-like alpha-amylase comporising alteration at one or more of the positions W13, G48, T49, S50, Q51, A52, D53, V54, G57, G107, G108, A111, S168 and M197. The alterations in (I) are independently an insertion of an amino acid downstream of the amino acid which occupies the position or deletion or substitution of the amino acid which occupies the position with a different amino acid. The variant in starch liquefaction, in detergent compositions containing it are useful in starch liquefaction, in detergent compositions such as laundry, dish washing and hard surface cleaning compositions, ethanol production such as fuel, drinking and industrial ethanol production, desizing of cleaving, substrate close to the branching point, and further exhibits improved substrate specificity and/or improved specific activity relative
                                                                                                                                                                                                                                                                                                                                                                                                                                             Andersen C

The alteration in (I) may be at Arg28, Arg118, Arg118, Arg181, Gly182, Asg183, Gly184, Gly186, Trp.189, Asn195, Met202, Tyr.288, Asg299, Lys.302, Ser303, Asn306, Arg310, Asn314, Arg320, His.244, Glu.445, Tyr.286, Arg400, Trp.439, Arg444, Asn445, Lys.446, Gln.449, Arg458, Asn471, or Asn464. (I) can be used for washing and/or dishwashing, textile desizing, and starch liquefaction. (I) is useful as a component in hard surface cleaning detergent composition, and for producing sweeteners and ethanol from starch. (I) has altered solubility, preferably increased solubility, in particular under washing, dish washing or hard surface cleaning conditions. The present sequence represents a Bacillus amyloliquefaciens termamyl-like alpha-amylase which is used in the exemplification of the present

The invention relates to a variant of parent TERMAMYL-like alpha- amylase comprising an alteration at regions 186-193, 261-276, 283-293 or 334-339, 20 or at position 234, where the variant has alpha-amylase activity and each position corresponds to a position of a parent Termamyl-like alpha- amylase sequence having a Bacillus licheniformis alpha-amylase sequence of 483 amino acids, given in specification. The variant alpha- amylase, a detergent additive comprising the variant or a detergent composition comprising the variant for washing and/or dishwashing or textile desizing. The alpha-amylase is useful for washing to the variant or a detergent composition or cethanol production and as a component in a hard surface cleaning constitute composition, and for producing sweeteners from starch. The variant has altered alpha-1, 6-D-glucosidic branch linkage cleavage activity on amylopectin, preferably increased alpha-1, 6-D-glucosidic branch linkage cleavage activity of amylopectin or a limit dextrin composition (RTM) or NOVANYL (RTM). The present sequence is a component of the TERMAMYL (RTM). The present sequence is a component of the TERMAMYL (RTM).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

                                                           The sequences given in AAB47850-56 show modified alpha-amylases derived crome the genus Bacillus. These alpha amylases are Termamyl- like alpha-cromylase and they have been pre-oxidized. The alpha amylase is useful for producing a maltodextrin or glucose syrup, by treating starch with a pre-cxidized alpha-amylase until a product with a DE between 5-45 has been provided and/or until a product with a molecular weight of between 5-30 cc provided and/or until a product with a molecular weight of between 5-30 cc lass been provided. The product comprises a maltodextrin with a DE of 18.5 and/or a maltodextrin with a molecular weight of 14-16 kda. The cc lapha amylase is useful for producing a maltodextrin or glucose syrup, compared the glucose syrup is useful as an ingredient in food, feed or compared the glucose syrup is useful in confectionery such as creat bars, beverages such as isotomic drinks, bakery such as cereal bars, conditions and ingredients and preparations such as cured consentional foods such as cased the salad dressings, and food ingredients and preparations such as cured meat, fermented meat, spices and seasoning encapsulated flavours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Alpha amylase; Bacillus; Termamyl-like; maltodextrin; glucose syrup; starch; food; feed; pharmaceutical; confectionery; candy; isotonic obakery; cereal bar; ice cream; coffee whitener; salad dressing;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Termamyl; alpha amylase; starch liquefaction; textile desizing; detergent; enzyme.
                                                                   This invention relates to variants of a parent Termamyl-like alpha-
amylases. These are used for starch liquefaction, ethanol production,
detergent, and textile desizing. The amylases have altered stability,
particularly at high temperatures from 70-120plusoC and low pH in the
range from pH 4.0-6.0. The present sequence is a termamyl-like-alpha-
                                                                                                                                                                                                                                                                 Variant of parent compositions, for dish washing, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Termamyl-like-alpha-amylase

(A) are used for cleaning textiles (by hand or machine) or hard surfaces (metal, glass, plastics etc.), especially in dishwashing machines. (I) can also be used to release other components of the compositions from starch-based capsules. The present sequence is that of the Bacillus amyloliquefaciens alpha-amylase of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 483 AA;

The glucose syrup obtained by the process is useful as an ingredient in food products. The Termamyl-like alpha-amylase facilitates the preparation of glucose syrups suitable for the food industry, previously only possible using acid hydrolysis. The present sequence represents Bacillus amyloliquefaciens Termamyl-like alpha-amylase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Disclosure; Page 32-34; 36pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a thermostable alpha-amylase (I) comprising the sequence given in AAB12433 (A) or deletions, replacements or insertions of one or more amino acid(s) in the sequence and alpha-amylase activity with less than 80% activity after treatment at 65 plus degrees Celsius for 30 minutes. Also described are: (1) DNAs encoding (I), (2) DNAs containing one of 4 nucleotide sequences comprising 1545 base pairs (see AAA60576 to AAA60579); (3) expression vectors containing the above mentioned DNAs; (4) host cells containing the above mentioned expression vectors; (5) preparation of a polypeptide having alpha-amylase activity by culture of the recombinant host cells; and (6) preparation of bread including a process to add (I) to the dough. (I) is useful in the preparation of bread. (I) improves the soft volume of the bread and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel thermostable alpha-amylase, useful for improving the preparation of bread, comprises alpha-amylase activity with less than 80% activity after treatment at 65degreesC for 30 min.

Patent No. 6143708
GENERAL INFORMATION:
APPLICANT: Svendsen, Allan
APPLICANT: Bisgard-Frantzen, Henrik
TITLE OF INVENTION: Alpha-Amylase Matants
FILL REFERENCE: 4796.204-US
CURRENT APPLICATION NUMBER: US/09/182,859
CURRENT FILING DATE: 1998-10-29
EARLIER APPLICATION NUMBER: 0515/96
EARLIER FILING DATE: 1996-04-30
